EECS E6893 Big Data Analytics
HW1: Clustering, Classification, and Spark MLlib

Frank Ou Yang, ho2271@columbia.edu

Agenda

- Spark Dataframe
- Spark SQL
- Spark MLlib
- HW1
  - Iterative K-means clustering
  - Logistic Regression

Spark Dataframe

- An *abstraction*, an immutable distributed collection of data like RDD
- Data is organized into named columns, like a table in DB
- Create from RDD, Hive table, or other data sources
- Easy conversion with Pandas Dataframe

Spark Dataframe: read from csv file

```
# read data from csv into Dataframe
df = spark.read.format("csv").option("header", 'true').load("gs://big_data_ta/data/citibike_stations.csv")
```

```
type(df)
```

```
pyspark.sql.dataframe.DataFrame
```

```
df.show(1)
```

```

dtypes: object(18)
memory usage: 118.6+ KB
```

Work with Spark SQL

```
# Play with Spark SQL
# Register the DataFrame as a SQL temporary view
df.createOrReplaceTempView("citibike")
```

```
sqlDF = spark.sql("""
        SELECT COUNT (DISTINCT station_id)
        FROM citibike
        """)
sqlDF.show()
```

```
+--------------------------+
|count(DISTINCT station_id)|
+--------------------------+
|                       843|
+--------------------------+
```

```
# get data out of df
sqlDF.select("count(DISTINCT station_id)").collect()[0]["count(DISTINCT station_id)"]
```

```
843
```

Spark MLlib

- Spark's scalable machine learning library
- Tools:
  - ML Algorithms: classification, regression, clustering, and collaborative filtering
  - Featurization: feature extraction, transformation, dimensionality reduction, and selection
  - Pipelines: tools for constructing, evaluating, and tuning ML Pipelines
  - Persistence: saving and load algorithms, models, and Pipelines
  - Utilities: linear algebra, statistics, data handling, etc.

Example: K-means clustering with Spark MLlib

```
from pyspark.mllib.clustering import KMeans
```

```
clusters = KMeans.train(data, 10, maxIterations=20, initializationMode="random")
```

```
# cluster centers
len(clusters.centers)
```

```
10
```

HW1

HW1

- Document clustering with K-means
  - “Implement” iterative K-means clustering in Spark
  - L1, L2 distance functions
  - Different initialization strategies
  - Plot the cluster assignment result with T-SNE dimensionality reduction
- Binary classification with Spark MLlib
  - Preprocess df with ML Pipeline
  - Logistic regression

Iterative K-means

- In each iteration, k centroids are initialized, each point in the space is assigned to the nearest centroid, and the centroids are re-computed
- Pseudo code:

Algorithm 1 Iterative k-Means Algorithm

```
1: procedure ITERATIVE k-MEANS
2:     Select k points as initial centroids of the k clusters.
3:     for iterations := 1 to MAX_ITER do
4:         for each point p in the dataset do
5:             Assign point p to the cluster with the closest centroid
6:         end for
7:         for each cluster c do
8:             Recompute the centroid of c as the mean of all the data points assigned to c
9:         end for
10:    end for
11: end procedure
```

Iterative K-means in Spark

Hint:
Spark operations you might need:
map, reduceByKey, collect, keys

Algorithm 1 Iterative k-Means Algorithm

```
1: procedure ITERATIVE k-MEANS
2:     Select k points as initial centroids of the k clusters.
3:     for iterations := 1 to MAX_ITER do
4:         for each point p in the dataset do
5:             Assign point p to the cluster with the closest centroid
6:         end for
7:         for each cluster c do
8:             Recompute the centroid of c as the mean of all the data points assigned to c
9:         end for
10:    end for
11: end procedure
```

```
# iterative k-means
for _ in range(MAX_ITER):
    # Transform each point to a combo of point, closest centroid, count
    # point -> (closest_centroid, (point, 1))

    # Re-compute cluster center

    # For each cluster center (key), aggregate its value by summing up points and count
    # Average the points for each centroid: divide sum of points by count
```

COVER STORIES

Plot the result with t-SNE

```
from sklearn.manifold import TSNE
```

```
# RDD -> np array
data_np = np.array(data.collect())
```

```
data_np.shape
```

```
(4601, 58)
```

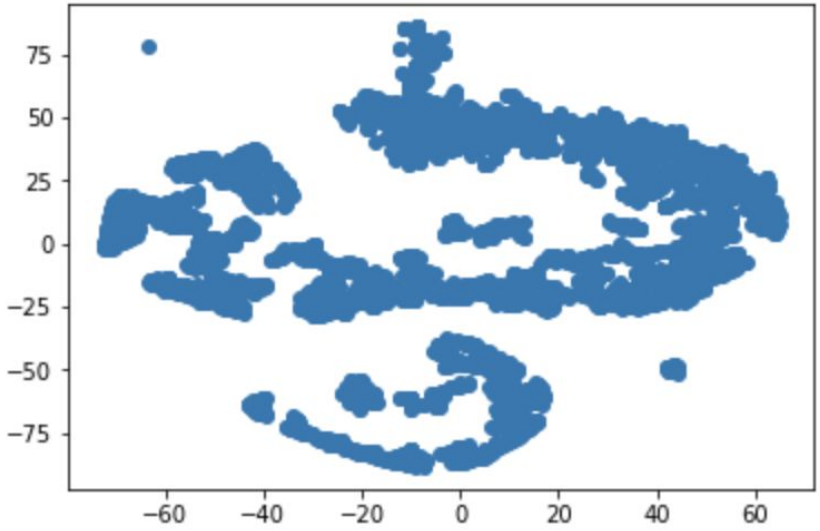
```
data_embedded = TSNE(n_components=2).fit_transform(data_np)
```

```
data_embedded.shape
```

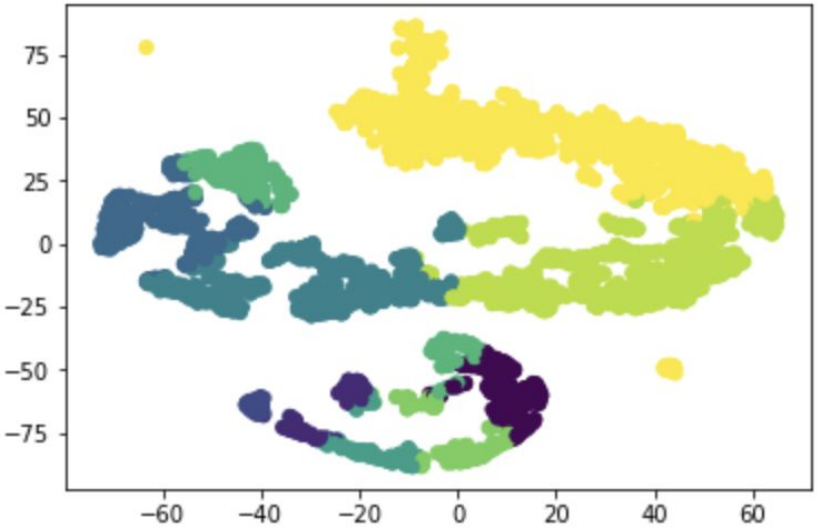
```
(4601, 2)
```

```
vis_x = data_embedded[:, 0]
vis_y = data_embedded[:, 1]
plt.scatter(vis_x, vis_y, cmap=plt.cm.get_cmap("jet", 10))
plt.show()
```

Plot the result with t-SNE

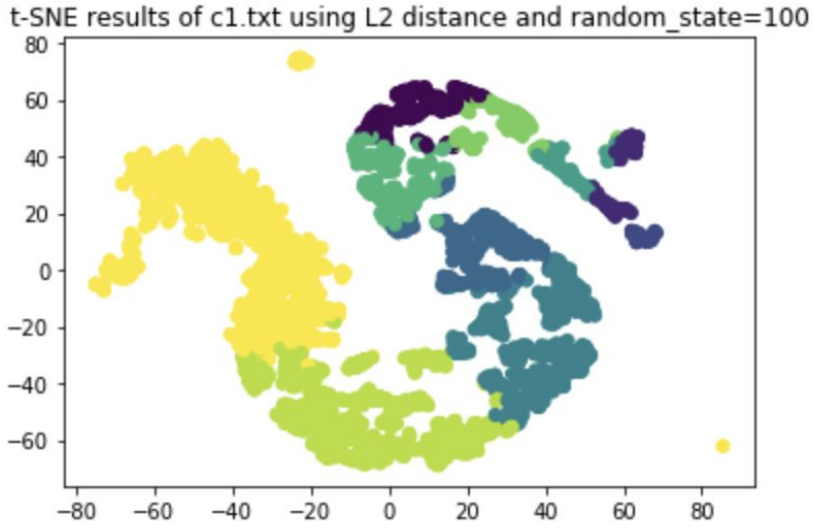


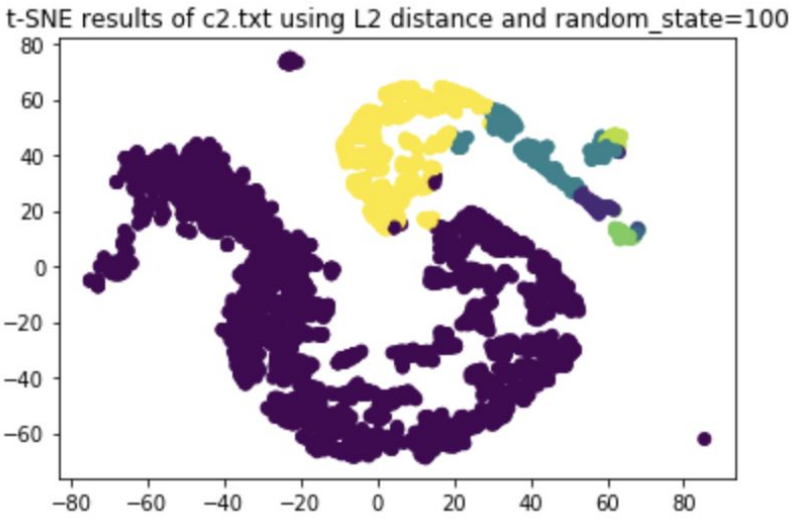
Before clustering



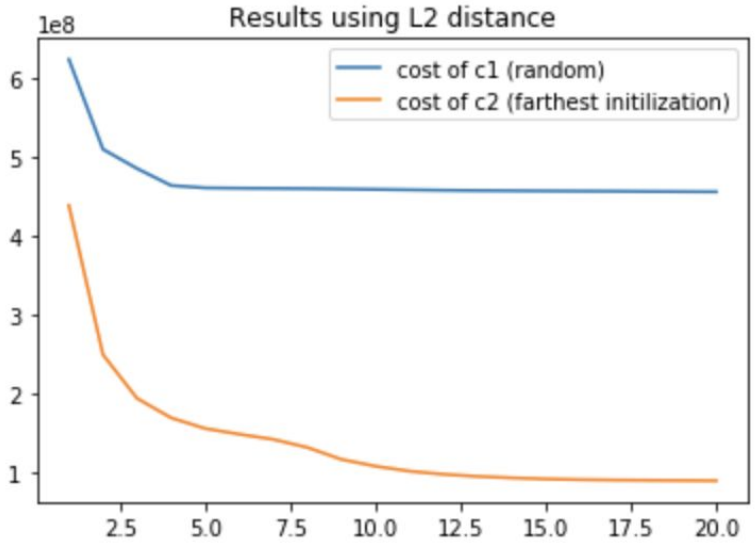
After clustering

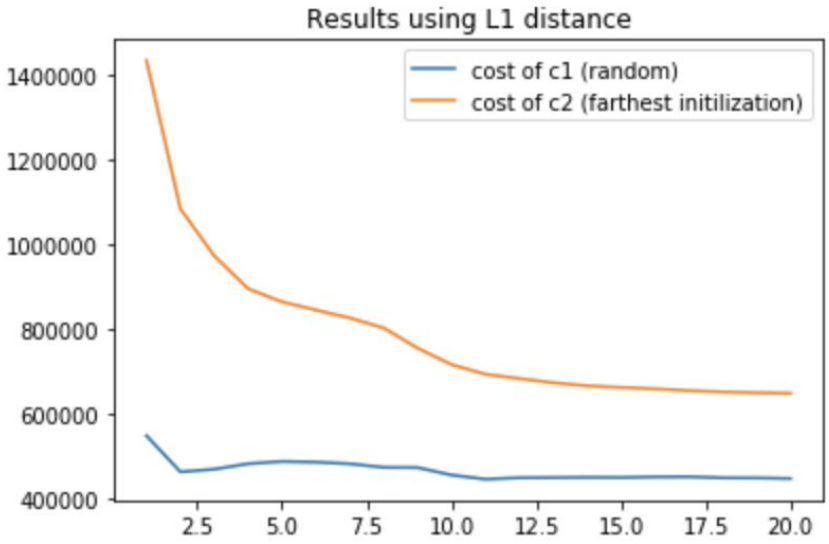
Plot the result with t-SNE (set random state)





Plot the cost of each iteration





Binary classification with Spark MLlib

- Adult dataset from UCI Machine Learning Repository
- Given information of a person, predict if the person could earn > 50k per year
- Workflow
  - Data loading: load data into Dataframe
  - Data preprocessing: Convert the categorical variables into numeric variables with ML Pipelines and Feature Transformers
  - Modelling: Conduct classification with Logistic Regression model
  - Evaluation
